New Product Bulletin

STA-PUT FILM

Our new and improved non-slip coating was developed to reduce cost. Our new coating no longer needs a clear polypropylene film for protection, which will assist in reducing the material cost. A clear film is still available if needed for processing the Sta-Put film. We are confident that you will find this new product to be far superior for your current or new applications.

WHITE OPAQUE BARRIER FILM

Our white opaque barrier film has been engineered for use in the printing industry. It has excellent printing characteristics as well as customized impact properties. Typical applications are for advertising cards, banners, posters, and signs that require a white opaque barrier film. Printers who have used our white opaque barrier film have said it is superior to other films and its cost is lower.

TRANSFER ADHESIVE

New 4 mil high performance unsupported acrylic pressure sensitive transfer adhesive that offers high peel strength, high sheer resistance and adheres well to a variety of substrates at a much lower cost than thicker transfer adhesives without sacrificing performance of thicker adhesives. This adhesive has good chemical and plasticizer resistance as well as good long-term aging. It has the ability to withstand environmental extremes.

DRY ERASE SATIN COATED FILM

A matte or gloss top coat that can be applied to a white PET film (2 mil to 5 mil) that has a pressure sensitive adhesive applied to the reverse side giving the user the best Dry Erase top coating available at considerably lower cost than was available in the past.

Samples are available for evaluation on any of our new products
